1.Introduction of CeTune

1.1. What is CeTune

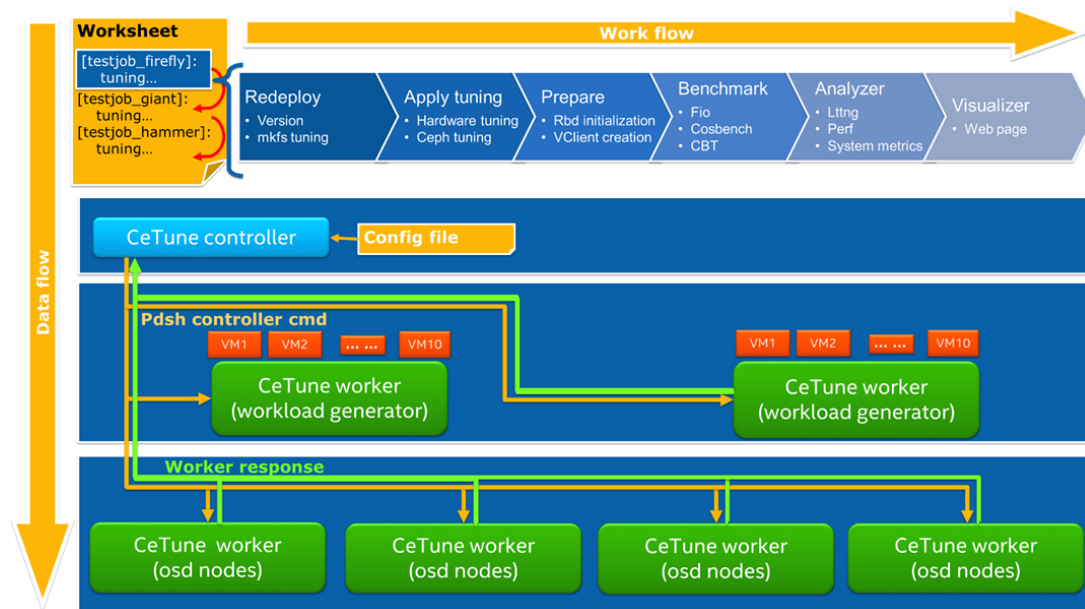

CeTune is a python-based framework, designed and implemented to profile and tune ceph cluster performance. This is the v1 version of CeTune, which is rewrite from the original shell-based Automation kit (cephperf).

In CeTune, we designed it to be kicked off by one click from deploy ceph cluster to benchmark and profile ceph and show performance report with HTML.

To reach that goal, CeTune comprises five distinct components. And using two config files to drive all these five components.

There are two roles in CeTune, CeTune controller and CeTune worker. Each ceph node includes mon, osd and client are all CeTune worker. They will receive job from CeTune controller to do deployment, create and attach rbd, run workload, recording system metrics and etc. The whole workflow overview is like below:

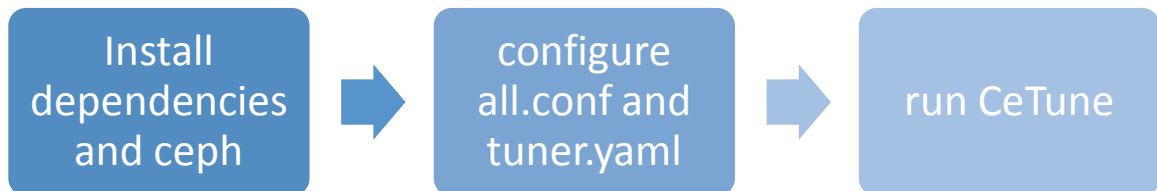

CeTune controller node can be any node in ceph cluster or even an individual node. We recommend to put CeTune controller at one of your client node. (Our test is on this scenario, so this will be more stable and bugless.)

1.2. How to use CeTune

CeTune is being able to help engineers doing deployment, benchmarking, vm setting up and other works like autossh, disk_partition.

We aim to make using CeTune as simple as possible, with only three major steps, you can run CeTune to do a whole test from zero ceph in cluster to complete the ceph performance report.

2. Preparations (install dependencies and ceph)

2.1. Install ceph-deploy

Ceph-deploy will be called from CeTune scripts to install and deploy ceph, so before using CeTune, make sure the ceph-deploy is installed.

```
[CeTune_controller]
pip install ceph-deploy
#check ceph-deploy is installed, the CeTune is tested from the ceph-deploy version of 1.5.2,
so please install a version higher than that, avoiding any unknown problems may occur.
ceph-deploy --version
```

2.2. Install dependencies

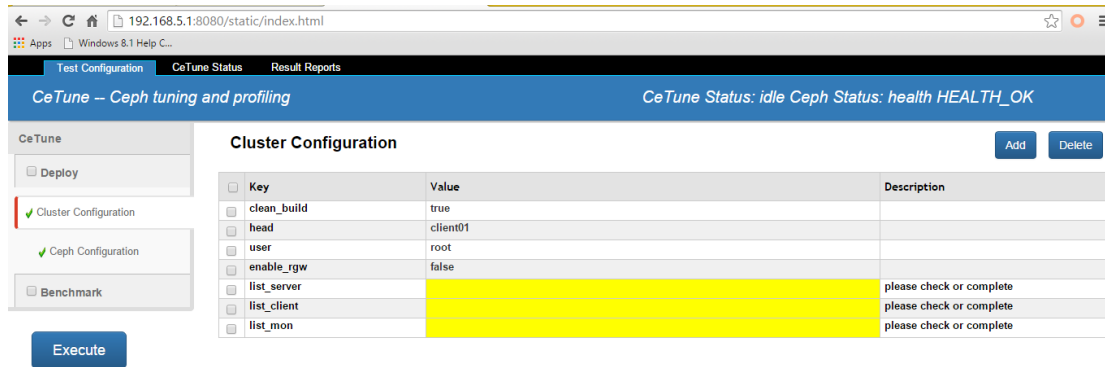

```
[CeTune_controller]
apt-get/yum install -y python-pip pdsh unzip zip expect sysstat curl openjdk-7-jre haproxy
python-matplotlib python-numpy
pip install ceph-deploy pyyaml argparse
[CeTune_worker]
apt-get/yum install -y python-pip unzip sysstat curl openjdk-7-jre haproxy
```

2.3. Install and deploy CeTune webui

```
[CeTune_controller]
# install webpy python module
Git clone https://github.com/webpy/webpy.git
cd webpy
python setup.py install
# run CeTune webui
cd {your-path}/CeTune/webui/
Python webui.py
```

```
#you will see below output
root@client01:/CeTune/webui# python webui.py
http://0.0.0.0:8080/
```

then, you can access this node:8080 by browser

For the first time login CeTune WebUI, you will need to fill out some configuration to describe your cluster, all these configuration will stored as all.conf and tuner.yaml files under CeTune/conf/ dir.

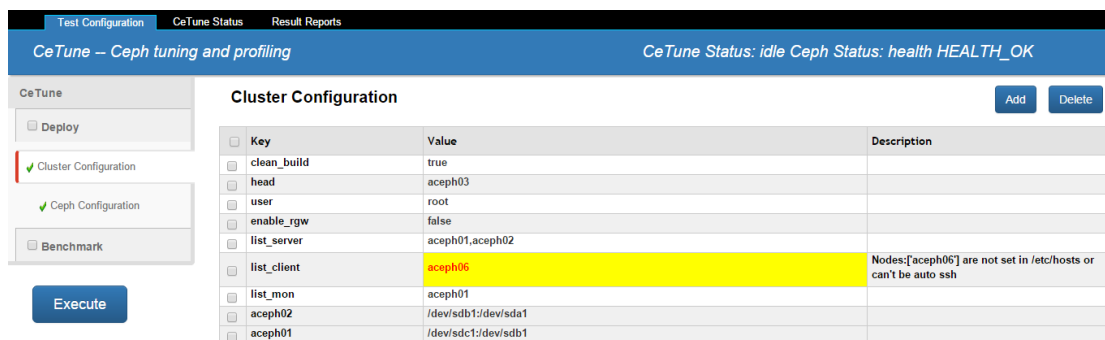

2.4. Prepare Cluster

CeTune Web UI provides a new way to prepare your cluster, you can configure on the WebUI at the same time, WebUI can help to check if you miss some preparation on the cluster.

Basically, the MUST DO preparations are:

a) *Enable the auto ssh to all ceph nodes.*

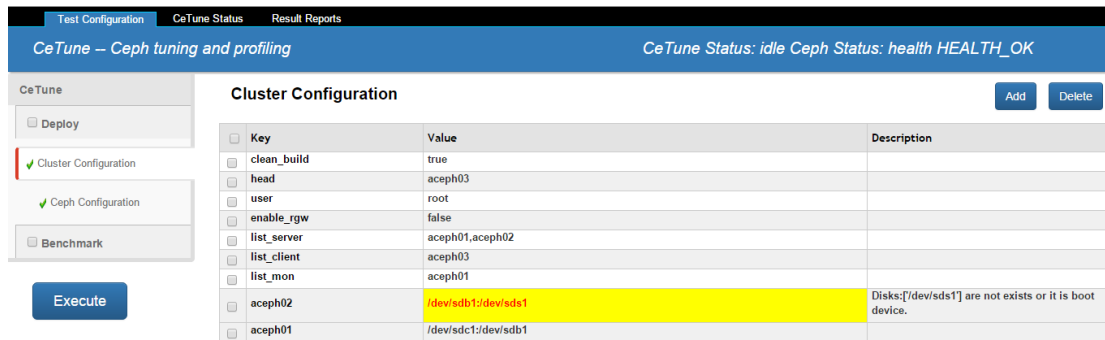

Which means the node you fill into the CeTune WebUI should also be auto ssh by CeTune Controller, or you will see below warning.

```
apt-get/yum install expect
#configure auto ssh by below command
cd deploy/prepare-scripts; ./configure_autossh.sh ${host} ${ssh_password}
```

b) *make sure you had already do the partition to the device name you input into CeTune WebUI.*

When you fill in the list_server slot, CeTune will create new configuration line whose key name is the osd node name, you should input osd_journal pair to these lines.

If the device not exists, or being a boot device, CeTune WebUI will give you warning like above. CeTune provides a partition script, please follow below to do partition.

[CeTune_controller]

```
# Fill all nodes list in list_server with desired osd_journal pair in conf/all.conf
# you can only use cli not webui
vim conf/all.conf
#config each osd node with osd_device and journal_device
osd_node1=${osd_device}:${journal_device}
example:
aceph01=/dev/sda1:/dev/sdb1,/dev/sdd1:/dev/sdb2,/dev/sde1:/dev/sdb3...
# how many partitions on one osd device and the size
# CeTune has script to do partitioning
# set the osd_partition_size to " ", CeTune will use whole disk space as one partition
osd_partition_count=1
osd_partition_size=2000G
# how many partitions on one journal device and the size
journal_partition_count=5
journal_partition_size=60G

cd deploy/prepare-scripts;
bash list_disk_partition.sh -l #To check current osd and journal device partition
bash list_disk_partition.sh -w #apply all.conf to osd and journal device
```

c) vm setup if necessary

If you plan to do rbd test inside VM, you need to prepare VM before list them into CeTune, all CeTune will warn you on these VM nodes not existing, Just refer to 3. VM setup

3. VM setup

If you plan to run qemuio benchmark on ceph cluster, CeTune also provides some scripts to setup VM, skip this chapter if you not plan to run fio in VM.

3.1. Set up hypervisor bridge network.

a) *Edit /etc/network/interfaces file.*

Add a new 'br0' network who bridge_ports to a physical nic (In the example, it points to 'eth0'), and copy the original physical nic(eth0) address, network, gateway settings to br0. Example is like below, 'eth0' should be replaced by the nic can connect to network in your own system.

```
[Ubuntu]
auto eth0
iface eth0 inet manual

auto br0
iface br0 inet static
address 192.168.5.31
netmask 255.255.0.0
gateway 192.168.2.200
bridge_ports eth0
bridge_stp off
bridge_fd 0
bridge_maxwait 0

[CentOS]
[root@client03 ~]# cat /etc/sysconfig/network-scripts/ifcfg-br0
DEVICE=br0
TYPE=Bridge
BOOTPROTO=static
ONBOOT=yes
IPADDR=192.168.5.31
NETMASK=255.255.0.0
DELAY=0
GATEWAY=192.168.2.200
[root@client03 ~]# cat /etc/sysconfig/network-scripts/ifcfg-eth0
DEVICE=eth0
HWADDR=00:1e:67:92:3c:2d
ONBOOT=yes
TYPE=Ethernet
BRIDGE=br0
USERCTL=no
```

b) *Restart the network service.*

```
[root@client01 ~]# ifdown eth0
[root@client01 ~]# ifup eth0
Possible Error:
Ignoring unknown interface br0=br0.
Solution:
```

```
[root@client01 ~]# apt-get/yum install bridge-utils
```

c) *Check the network setting*

```
# System route to 192.168.0.0 by br0
```

```
root@ceph-client1:~# route
```

```
Kernel IP routing table
```

Destination	Gateway	Genmask	Flags	Metric	Ref	Use	Iface
default	192.168.2.200	0.0.0.0	UG	0	0	0	br0
172.16.96.0	*	255.255.240.0	U	0	0	0	eth2
172.16.96.0	*	255.255.240.0	U	0	0	0	eth5
192.168.0.0	*	255.255.0.0	U	0	0	0	br0
192.168.122.0	*	255.255.255.0	U	0	0	0	virbr0

3.2. Prepare VMs

d) *Use the scripts in vm-scripts to prepare vm*

```
[CeTune_controller]
```

```
Set conf/all.conf to create vm image
```

```
vim conf/all.conf
```

```
list_vclient=vclient01,vclient02,vclient03,vclient04...
```

```
cpuset_start=0 #when pin vm vcpu to hypervisor cpu, will start from cpu 0
```

```
vm_num_per_client=40 #after create 40 vms, will re-pin vcpu to hypervisor cpu 0
```

```
img_path_dir=/mnt/images #output created vm image folder
```

```
ip_prefix=192.168.5 #ip_prefix and ip_fix specify the vm ip,
```

```
ip_fix=161 #in below case, vm ip start from 192.168.5.161
```

```
vm_image_locate_server=10.239.158.45 #the remote_dir of tmp_vclient.image
```

```
cd vm-scripts/
```

```
bash prepare-vm.sh
```

```
scp -r vmxml/ ${img_path_dir_mnt} ${client_node} #scp vclient.xml and vclient.img to clients
```

3.3. Create VMs

```
virsh create {xml-file-path}
```

Tip: check the file /etc/hosts in one of clients(the one which has dir CeTune), make sure it had recorded all IP addresses of VMs. After the creating of VMs, please guarantee that all the VMs can be logged on with SSH.

```
[example]
```

```
for i in `seq 1 4`; do virsh create vmxml/vclient${i}.xml;done
```

```
Domain vclient01 created from vmxml/vclient01.xml
```

```
Domain vclient02 created from vmxml/vclient02.xml
```

```
Domain vclient03 created from vmxml/vclient03.xml
```

```
Domain vclient04 created from vmxml/vclient04.xml
```

```
root@ceph-client1:~/CeTune/vm-scripts# virsh list
```

Id	Name	State
----	------	-------

```
-----
19  vclient01                running
20  vclient02                running
21  vclient03                running
23  vclient04                running
```

3.4. Rbd volume creation

Below is the instruction mostly used for deploy ceph with cephx authentication.

e) *Create rbd volume*

This script will read the current rbd volume number and vclient number in all.conf, then create proper number of rbd volumes to ensure each vm has one rbd volume. So if you has enough rbd volume for vclient, this script will do nothing.

```
bash create-volume.sh create_rbd
```

f) *Create rbd_disk.xml*

```
#create rbd volume xml with cephx authentication
```

```
bash create-volume.sh create_disk_xml
```

If you use CephX, pls make sure the secret.xml locates in vm-scripts

1) secret.xml exists, continue with cephx

2) help to generate secret.xml first than create volume

3) continue with none auth

```
#? 2
```

```
Secret b9e48882-7485-4312-ac5b-4148409d59e1 created
```

```
Secret value set
```

```
cat vdb/vclient01.xml
```

```
<disk type='network' device='disk'>
```

```
  <driver name='qemu' type='raw' cache='none' />
```

```
  <auth username='admin'>
```

```
    <secret type='ceph' uuid='b9e48882-7485-4312-ac5b-4148409d59e1' />
```

```
  </auth>
```

```
  <source protocol='rbd' name='rbd/volume-72a2a44b-ab14-4447-a49c-2bf7a80bde8a' />
```

```
  <target dev='vdb' bus='virtio' />
```

```
  <serial>009ad738-1a2e-4d9c-bf22-1993c8c67ade</serial>
```

```
  <address type='pci' domain='0x0000' bus='0x00' slot='0x06' function='0x0' />
```

```
</disk>
```

```
#create rbd volume xml with none authentication
```

```
bash create-volume.sh create_disk_xml
```

If you use CephX, pls make sure the secret.xml locates in vm-scripts

1) secret.xml exists, continue with cephx

2) help to generate secret.xml first than create volume

3) continue with none auth

```
#? 3
```

```
cat vdfs/vclient01.xml
<disk type='network' device='disk'>
  <driver name='qemu' type='raw' cache='none' />
  <source protocol='rbd' name='rbd/volume-72a2a44b-ab14-4447-a49c-2bf7a80bde8a' />
  <target dev='vdb' bus='virtio' />
  <serial>009ad738-1a2e-4d9c-bf22-1993c8c67ade</serial>
  <address type='pci' domain='0x0000' bus='0x00' slot='0x06' function='0x0' />
</disk>
```

g) *rbd volume attach*

```
virsh attach-device ${vclient} ${vclient.xml}
```

```
[example]
for i in `seq 1 4`; do virsh attach-device vclient0${i} vdfs/vclient${i}.xml; done
Device attached successfully
Device attached successfully
Device attached successfully
Device attached successfully

#check the rbd volume is attached to vm successfully
for i in `seq 1 4`; do echo vclient0${i}; virsh dumpxml vclient0${i} | grep rbd; done
vclient01
  <source protocol='rbd' name='rbd/volume-72a2a44b-ab14-4447-a49c-2bf7a80bde8a' />
vclient02
  <source protocol='rbd' name='rbd/volume-a856d868-a065-4127-8b7b-c0d1dfb06e77' />
vclient03
  <source protocol='rbd' name='rbd/volume-ad0c107a-8d8a-47eb-b558-23ad7ee61967' />
vclient04
  <source protocol='rbd' name='rbd/volume-db060f87-08df-4c8c-ba6d-6f7a94d64531' />
```

4. Ceph installation and deployment

4.1. Ceph installation

Current CeTune installs ceph by ceph-deploy and only support installing rbd as client.

a) *Check the network connection*

Please edit the files /etc/apt/apt.conf, /etc/environment and /etc/wgetrc to make sure that the proxy of all node in your cluster are available, including client and server, and if your system is CentOS, you need to edit your file /etc/yum.conf to make sure your proxy is available.

[CeTune_worker]

```
Check apt-get / yum is able to connect to the repository
Wget ceph.com #make sure wget is able to connect to ceph.com
```

Add all Ceph node include osd, mon, client into [CeTune controller]'s hosts file

If your cluster using different nic driver as cluster network and public network, remember to add all nic driver ip into /etc/hosts.

[CeTune_controller]

make sure all your osd, mon, rbd client can be connected through the controller node.
Or you can use script in CeTune help you to do the autossh setting.

```
apt-get/yum install expect
```

```
Cd deploy/prepare-scripts; ./configure_autossh.sh ${host} ${ssh_password}
```

b) Configure server list in all.conf

Fill in 1)list_server, 2)list_client, 3)list_mon, so CeTune will install ceph pkg to these nodes.

The screenshot shows the CeTune web interface. On the left, there is a sidebar with navigation options: Deploy, Cluster Configuration (selected), Ceph Configuration, and Benchmark. The main area is titled 'Cluster Configuration' and contains a table with columns 'Key', 'Value', and 'Description'. The table lists various configuration parameters. A red box highlights the following rows:

Key	Value	Description
clean_build	true	
head	aceph03	
user	root	
enable_rgw	false	
list_server	aceph01,aceph02	
list_client	aceph03	
list_mon	aceph01	
aceph02	/dev/sdb1:/dev/sda1	
aceph01	/dev/sdc1:/dev/sdb1	

c) Install ceph

There are two interface to install ceph, by CeTune CLI or CeTune WebUI

Below is how install ceph by CeTune CLI, by CeTune WebUI, you can just forward to

[CeTune_controller]

```
cd deploy
```

```
python run_deploy.py install_binary --version hammer
```

d) Purge ceph

[CeTune_controller]

```
cd deploy
```

```
python run_deploy.py uninstall_binary
```

You can see ceph -v at the end if you succeeded in installing ceph

4.2. Ceph deployment

To deploy ceph cluster by CeTune UI, there are two mode: 1) clean_build 2)non_clean_build

Clean_build : this mode is for first time ceph deployment or you want to destroy your ceph cluster and build a new one, please set clean_build as true as below

Test Configuration

CeTune Status

Result Reports

CeTune – Ceph tuning and profiling

CeTune Status: idle Ceph Status: health HEALTH_OK

CeTune

Deploy

Cluster Configuration

Ceph Configuration

Benchmark

Execute

Cluster Configuration

Add

Delete

Key	Value	Description
clean_build	true	
head	aceph03	
user	root

[2015-10-01T02:14:41.381519][LOG] delete ceph pool rbd
[2015-10-01T02:14:42.002964][LOG] create ceph pool rbd, pg_num is 100
[2015-10-01T02:14:43.523525][LOG] set ceph pool rbd, size to 2
[2015-10-01T02:14:44.740525][WARNING] Applied tuning, waiting ceph to be healthy
[2015-10-01T02:14:48.056431][WARNING] Applied tuning, waiting ceph to be healthy
[2015-10-01T02:14:51.352547][WARNING] Applied tuning, waiting ceph to be healthy
[2015-10-01T02:14:54.650550][WARNING] Applied tuning, waiting ceph to be healthy
[2015-10-01T02:14:57.950397][LOG] Tuning has applied to ceph cluster, ceph is Healthy now
```

Then ceph cluster is deployed.

4.4. Non clean build to add radosgw

a) Clean_build to false

b) Enable 'enable_rgw' to true

After enable rgw, you need to fill the adding configuration lines.

cosbench_controller_proxy: leave this line blank, if you need to http_proxy to access radosgw

Test Configuration

<input type="checkbox"/> cosbench_auth_password	intel2012	

c) Click 'Execute'

4.5. Non clean build to add osd

- Clean_build to false
- Add new osd node or device in cetune webui
- Click 'Execute'

5.Benchmark

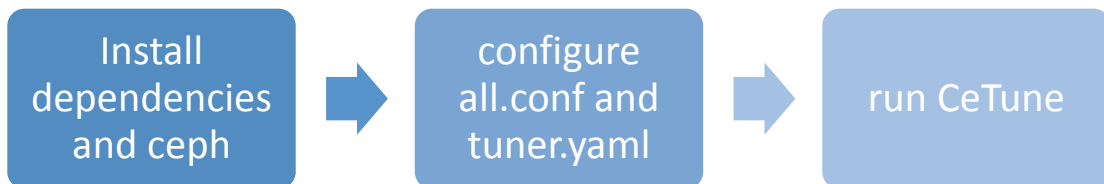

5.1. Basic Execution Flow

As mentioned at chapter 2, the basic execution flow to use CeTune is

(1)install, (2)configure, (3)run.

Till now, we had installed ceph and all the dependencies; and create vclint if necessary.

All remained to do is do the configuration and kickoff CeTune.

5.2. Configuration

- Configure benchmark session in CeTune WebUI

Go through each tab under Benchmark, and specify the testcase you desired under benchmark configuration. Like below

Test Configuration
CeTune Status
Result Reports

CeTune – Ceph tuning and profiling
CeTune Status: idle Ceph Status: health HEALTH_OK

6. Appendix

In the processing of installing ceph you may encounter the follow problems, and here are some tips for solving them.

6.1. CETUNE CONFIGURATIONS

a) CLUSTER CONFIGURATION

<i>clean_build</i>	true / false	Refer to 4.3-4.5
<i>head</i>	<code>\${cetune_controller}</code>	Must be the
<i>user</i>	root	Only support 'root'
<i>list_mon</i>	<code>\${ceph_monitor_node}</code>	
<i>list_server</i>	<code>\${ceph_osd_nodes1},\${ceph_osd_nodes2}, \${ceph_osd_nodes3},\${ceph_osd_nodes4}</code>	using ',' to separate
<i>list_client</i>	<code>\${ceph_client1},\${ceph_client2}, \${ceph_client3},\${ceph_client4}</code>	using ',' to separate
<i>enable_rgw</i>	true / false	Only deploy rgw when enable rgw
<i><code>\${ceph_osd_nodes1}</code></i>	<code>/dev/sdb1:/dev/sdg1,/dev/sdc1:/dev/sdg2...</code>	Specify osd_device and journal_device join with ':',
<i>rgw_num_per_server</i>	5	Listening on 5 ports at one node
<i>cosbench_auth_username</i>	cosbench:operator	
<i>rgw_server</i>	<code>\${ceph_rgw_node}</code>	
<i>cosbench_controller_proxy</i>	""	Proxy to the rgw server
<i>rgw_start_index</i>	1	
<i>cosbench_auth_password</i>	Intel2012	

b) CEPH CONFIGURATION

<i>mon_data</i>	<code>/var/lib/ceph/ceph.\$id</code>	Monitor dir path
<i>osd_objectstore</i>	filestore	
<i>public_network</i>	10.10.5.0/24	Data network (rbd to cluster)
<i>cluster_network</i>	10.10.5.0/24	Data network (among osd)

c) SYSTEM CONFIGURATION

<i>disk read_ahead_kb</i>	2048
<i>disk max_sectors_kb</i>	512
<i>disk scheduler</i>	deadline

d) *CEPH TUNING*

<i>pool rbd size</i>	2
<i>pool rbd pg_num</i>	8192
<i>global mon_pg_warm_max_per_osd</i>	1000

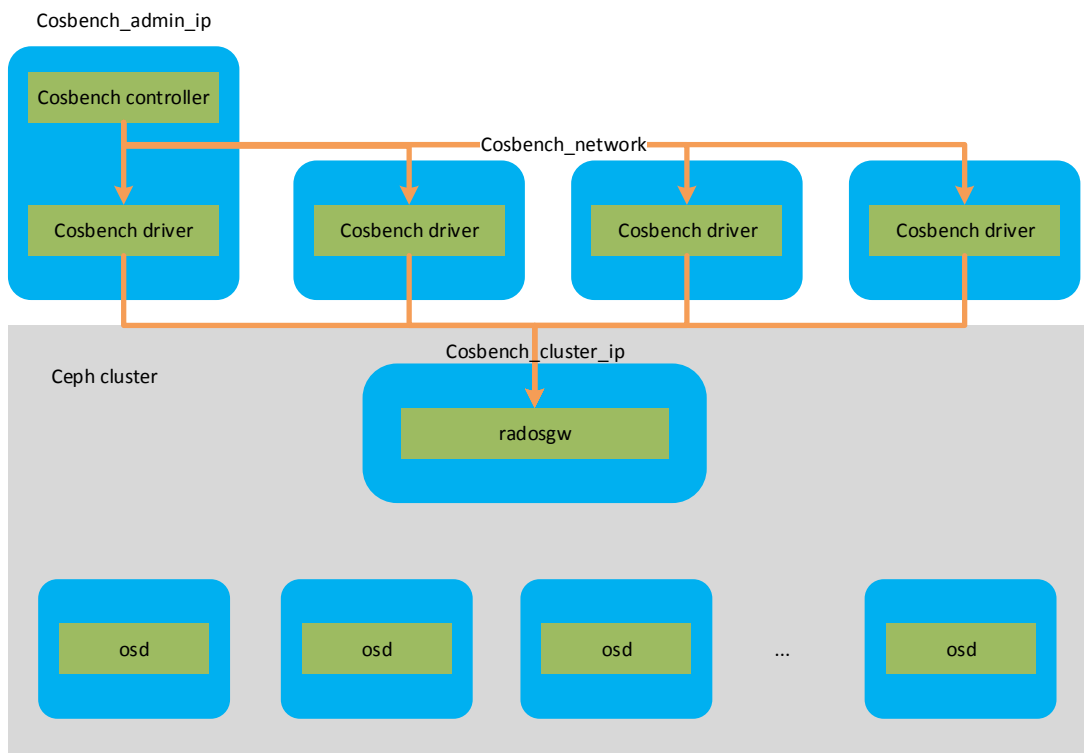

Specify ceph tuning here, if tuning is under [global] section, then using 'global|\${tuning}' as key.

e) *BENCHMARK CONFIGURATION*

<i>tmp_dir</i>	/opt/	Dir to temporary store raw data at each nodes(vm, clients, osds)
<i>dest_dir</i>	/mnt/data	Result_dir
<i>cache_drop_level</i>	1/3	1: only drop pagecache 3: drop pagecache and inode
<i>monitoring_interval</i>	\${num}	Record system metrics interval by \${num} sec
<i>list_vclient</i>	\${vm1},\${vm2}, \${vm3},\${vm4},...	using ',' to separate
<i>fio_capping</i>	true/false	If true, bw capping to 60MB/s each vm, iops capping to 100
<i>volume_size</i>	40960	One rbd volume size
<i>rbd_volume_count</i>	140	Total rbd volume
<i>disk_num_per_client</i>	35,35,35,35	need to tell cetune here of how many rbd belong to one client(hypervisor), so cetune can choose first n rbd of each client to test
<i>rwmixread</i>	100	Read ratio at readwrite mode

<i>cosbench_version</i>	v0.4.2.c2	
<i>cosbench_controller</i>	<code>\${ceph_client_node1}</code>	Choose one client node as controller
<i>cosbench_driver</i>	<code>\${ceph_client1},\${ceph_client2}, \${ceph_client3},\${ceph_client4}</code>	All clients will be cosbench driver here
<i>cosbench_folder</i>	<code>/opt/cosbench</code>	Downloaded cosbench package will be installed at this dir
<i>cosbench_config_dir</i>	<code>/opt/cosbench_config</code>	Dir to installed cosbench configurations
<i>cosbench_cluster_ip</i>	<code>\${rgw_node_ip}</code>	Rgw node ip address, please choose 10Mb/s ip if possible
<i>cosbench_admin_ip</i>	<code>\${rgw_node_ip}</code>	This ip is used to log on to cosbench controller webui
<i>cosbench_network</i>	<code>192.168.5.0/24</code>	Used for cosbench controller contacting cosbench drivers

Using graph below to demonstrate the where 'cosbench_admin_ip', 'cosbench_network', 'cosbench_cluster_ip' are being used.

6.2. CLI COMMANDS

Cetune modules like 'deploy', 'benchmark', 'analyze', 'visualize' can also run separately. Using below command to run

```
# Install ceph package
```

```

cd deploy; python run_deploy.py install_binary --version ${version}
# Uninstall ceph package
cd deploy; python run_deploy.py uninstall_binary
# Redeploy ceph cluster
cd deploy; python run_deploy.py redeploy
# Restart ceph cluster
cd deploy; python run_deploy.py restart
# Deploy ceph radosgw
cd deploy; python run_deploy.py deploy_rgw
# Generate ceph conf from tuner.yaml
cd deploy; python run_deploy.py gen_cephconf
# Send generated ceph conf to all osd and client node.
cd deploy; python run_deploy.py distribute_conf
# Generate test cases for cosbench and fio
cd benchmarking; python run_cases.py -option gen_case
# Run benchmark following the sequence in ../conf/cases.conf
cd benchmarking; python run_cases.py
# Do analyze on one cetune test result
cd analyzer; python analyzer.py -path ${path} process_data
# Do visualize on one cetune analyzed result, need result.json doc under ${path}
cd visualizer; python visualizer.py -path ${path} generate_summary_page

```

6.3. OS type 'hvm' unknow

When you creating vclient by virsh and encounter the error below:

error: unknown OS type hvm

error: internal error: no supported architecture for os type 'hvm'

[solution]

```

#Check virsh capabilities firsr
virsh capabilities | grep os_type
<os_type>hvm</os_type>
#if not get above data, which means kvm is not installed correctly

apt-get/yum install qemu_kvm
modprobe kvm
modprobe kvm_intel
lsmod | grep kvm
kvm-ok
virsh capabilities #then you can find os type is hvm

```

```

<guest>
  <os_type>hvm</os_type>
  <arch name='x86_64'>
    <wordsize>64</wordsize>
    <emulator>/usr/bin/qemu-system-x86_64</emulator>

```

6.4. operation failed: open disk image file failed

```
#Firewall may not being give privilege to virsh
/etc/init.d/apparmor teardown or aa-complain /etc/init.d/libvirt-bin
/etc/init.d/libvirt-bin restart
Re-create vclient
```

6.5. How to install fio with rbd engine

```
#Make sure librbd-dev and librados-dev is installed, or you won't be able to configure fio
with rbdengine
dpkg -l | grep librbd-dev
ii librbd-dev 0.80.9-1trusty amd64 RADOS block device client library (development files)
dpkg -l | grep librados-dev
ii librados-dev 0.80.9-1trusty amd64 RADOS distributed object store client library
(development files)
git clone https://github.com/axboe/fio.git
cd fio
./configure
make
make install
fio --enghelp
Available IO engines:
    cpuio
    mmap
    sync
    psync
    vsync
    pvsync
    null
    net
    netsplice
    libaio
    posixaio
    falloc
    e4defrag
    splice
    rbd
    sg
    binject
```

6.6. pgs stuck unclean

```
root@aceph01:/var/log/ceph# ceph -s
```

```
cluster 2f96f09f-d911-4c69-8236-053e6d15fb11
health HEALTH_WARN 1024 pgs stuck unclean
monmap e1: 1 mons at {aceph01=172.16.96.11:6789/0}, election epoch 2, quorum 0 aceph01
osdmap e70: 16 osds: 16 up, 16 in
pgmap v136: 1024 pgs, 1 pools, 0 bytes data, 0 objects
          587 MB used, 14896 GB / 14896 GB avail
          1024 active
```

[solution]

```
ceph osd dump | grep pool    #dump the information of pool
ceph osd tree                #check osd status
#if all above is ok, then
ceph osd pool set rbd size 1
#wait ceph to be healthy, then
ceph osd pool set rbd size ${replica_size}
```
